Control Flow in R: Takeaways

Concepts

- Control flow is a form of decision making in code. Using comparison operators, we can decide what code to run based on if a value satisfies a given condition.
- The `if` statement provides us with a way to implement a *branching path* structure to our code. The `if_else()` and `case_when()` functions are vectorized implementations of the `if` statements, which we can use to create new columns in our dataset based on control flow.
- A `for` loop is a short, clean way to apply the same code to a vector of values. `for` loops allow us to designate a code chunk that should be applied to all the elements of a given vector. For the most part, vectorization helps perform the same function of a `for` loop, so for now, we do not need to write our own loops.

Syntax

- An

  ```
  if
  ```

  statement can be written like the following:

  ```
  if (insert comparison operator here) {
        print("Code to run if the comparison operator is TRUE")
      } else {
        print("Code to run if the comparison operator is FALSE")
      }
  ```

- The

  ```
  if_else()
  ```

  function vectorizes a simple two-branch decision tree:

  ```
  new_recent_grads <- recent_grads %>%
        mutate(
      is_engineering = if_else(Major_category == "Engineering", TRUE, FALSE)
        )
  ```

- To create a multiple comparison in an `if_else()` function, you must use `&` and `|` instead of `&&` and `||`:
  ``` a <- 1:3 b <- 4:6 d <- if_else(a > 2 & b > 5, TRUE, FALSE)
  d [1] FALSE FALSE TRUE ```
- The `case_when()` function vectorizes a more complex, 2+ branch decision tree:

```
new_recent_grads <- recent_grads %>%
      mutate(
        size_classification = case_when(
          Total < 2000 ~ "Small",
          Total > 20000 ~ "Large",
          TRUE ~ "Medium
        )
      )
```

- The `%in%` operator helps us create a comparison operator based on a membership test. If a value is in a given collection, then it will evaluate to `TRUE`. `FALSE`, otherwise.

```
recent_grads %>%
      filter(
        Major %in% c("AEROSPACE ENGINEERING", "BIOMEDICAL ENGINEERING", "CHEMICAL ENGINEERING")
      )
```
```

- We can use the ! character to invert logical values and comparison operators. ``` x <- 10
  x == 10 [1] TRUE
  !(x == 10) [1] FALSE ```
